**NEW 7-ALPHA, 17-ALPHA-BIS-ALKYLATED TESTOSTERONE DERIVATIVES AND  
THEIR USE FOR LONG-TERM THERAPY FOR ANDROGEN-DEPENDENT DISEASES**

*Dr B*

This invention relates to new  $7\alpha$ ,  $17\alpha$ ,  $17\beta$ -substituted testosterone derivatives of general formula I and their use as pure antiandrogens for long-term therapy for androgen-dependent diseases, especially for long-term antiandrogen therapy for prostate cancer.

Current therapies of androgen-dependent diseases are based on the reduction or as complete as possible elimination of androgen-induced effects. This can be done by blocking the domains of androgen receptor (AR), to which the androgens bind as ligands, or by reduction of the available amount of androgens themselves (ligand depletion). In prostate cancer treatment, "ligand depletion" means a reduction of the serum testosterone level of testicular origin, which is to be achieved either with use of orchidectomy (removal of a testicle) or by hormone treatment with LHRH analogs or estrogens in high doses. This therapy for inhibiting androgen synthesis and/or reducing androgen concentration is effective only to a limited extent, however, since it has been noted in the meantime that even in the case of total absence of an androgen, non-blocked androgen

09869000-052201

receptors can be biologically active (ligand-independent AR activation).

As an alternative or as an amendment to "ligand depletion," the antiandrogen therapy is used, which is based on the antagonistic blocking of the androgen receptor by so-called "antiandrogens" (nonsteroidal or steroidal compounds). Known antiandrogens, which are already used in clinical practice for prostate cancer treatment, are CPA (Schering AG), flutamide (Schering Plough), Casodex (Zeneca) and Anandron<sup>(R)</sup> (Roussel).

Although 80% of patients first respond to the above-mentioned therapies, almost all of these patients suffer a relapse as early as after an average treatment period of 12-18 months. It has been shown that even the AR blocking by the currently available antiandrogens is inadequate, since the latter either have insufficient active strength and/or can even activate the androgen receptor, i.e. can act like androgens (partial agonism).

Compounds that can act as inhibitors of androgen synthesis and/or as blockers of the androgen receptor are also described in WO91/00732. In this case, these are substituted steroids, which have at least one long side chain in one of positions  $6\alpha$ ,  $7\alpha$ ,  $14\alpha$ ,  $15\alpha$ ,  $16\alpha$ ,  $17\alpha$  and  $17\beta$ . Described as preferred compounds are EM 101, a testosterone that is substituted in  $17\beta$ -position with hydroxy and in  $7\alpha$ -position with a long-chain alkylamide, and EM 150, a testosterone that is substituted in  $17\beta$ -position with hydroxy and in  $17\alpha$ -position with a long-chain iodoalkine. These compounds also have the above-described drawbacks.

09859000.052201

In summary, it has been determined that there is currently no satisfactory therapy for androgen-dependent diseases, such as, e.g., for prostate cancer, and in particular no long-term therapy is possible. The known antiandrogen compounds do not have the necessary active strength to ensure complete blocking of the androgen receptor activity or to have a partially agonistic action.

The object of this invention was therefore to provide potent antiandrogenic compounds that make possible a long-term therapy for androgen-dependent diseases. In particular, prostate cancer can be treated effectively with these compounds.

The object of this invention is achieved by new  $7\alpha$ -,  $17\alpha$ -,  $17\beta$ -substituted testosterone derivatives of general formula I

in which

$R^6$  represents a hydrogen atom, a hydroxy group, a  $C_1$ - $C_{10}$  alkoxy group, a  $C_1$ - $C_{10}$  alkanoyloxy group or a halogen atom,

$R^{15}$  and  $R^{16}$  each are a hydrogen atom or together form a bond,

T02290-00098660

D represents a hydrogen atom, a C<sub>1</sub>-C<sub>4</sub> alkyl group, a vinyl group, a C<sub>1</sub>-C<sub>4</sub> alkoxy group, a C<sub>1</sub>-C<sub>4</sub> alkoxycarbonyl group, a bis(C<sub>1</sub>-C<sub>4</sub> alkoxycarbonyl)methyl

group, an acetyl( $C_1$ - $C_4$  alkoxy carbonyl)methyl group, a cyano group, a carboxy group, an azide group, a hydroxy group, a halogen atom or a radical of formula  $C_nF_mH_o$ , whereby  $n = 1, 2, 3$  or  $4$ ,  $m > 1$  and  $m+o=2n+1$ .

In a preferred embodiment of the invention,  $R^{17a}$  in general formula I means the methyl or ethyl group or the trifluoromethyl or pentafluoroethyl group. Radical  $R^{17b}$  preferably represents the hydroxy group, a  $C_1$ - $C_5$  alkoxy group or a  $C_1$ - $C_3$  alkanoyl group. Quite especially preferably,  $R^{17b}$  means the hydroxy, methoxy, ethoxy or acetyloxy group. For radical  $R^6$ , a hydrogen atom, the hydroxy group or a halogen atom is preferred. In a quite especially preferred embodiment of the invention, the radical ABCD means 9-hydroxynonyl, 7-(acetylsulfanyl)heptyl or 7-(4-cyanobutoxy)heptyl.

For the purposes of this invention, the alkylene groups that are mentioned for grouping A are the heptane-1,7-diyl, the octane-1,8-diyl, the nonane-1,9-diyl, the decane-1,10-diyl, the undecane-1,11-diyl, the dodecane-1,12-diyl and the tridecane-1,13-diyl group. The equivalent applies for the alkylene groups that are defined as grouping C.

The alkyl groups that are mentioned for substituents Y and D stand both for the unbranched groups, i.e., the methyl, ethyl and propyl group, and the corresponding higher homologues, in so far as they are claimed, and for the branched representatives of the above-mentioned carbon atom numbers, e.g., the 1-methylethyl group, the 1-methylpropyl group, the 2-methylpropyl group, the 1,1-dimethylethyl group, etc. Moreover, alkyl groups are also to

09869000 062201  
102290 00069860

be defined as cyclic substituents, depending on the above-mentioned carbon atom number, e.g., the cyclopropyl, cyclopropylmethyl, cyclobutyl, cyclopentyl, methylcyclopentyl, cyclopentylmethyl and cyclohexyl radicals.

Alkoxy groups are radicals that are derived from the above-mentioned alkyl groups and extended by one oxygen atom, thus, e.g., the methoxy, ethoxy, propoxy, 1-methylethoxy, 1-methylpropoxy, 2-methylpropoxy and 1,1-dimethylethoxy radicals.

For the purposes of this invention, alkanoyloxy groups are defined as hydroxy groups that are esterified with branched and unbranched carboxylic acids of the above-mentioned numbers of carbon atoms, thus, e.g., the formyloxy, acetyloxy, 1-oxopropoxy, 1-oxobutoxy, and 2-methyl-1-oxopropoxy radical.

The arylene and heteroarylene groups that are indicated for grouping C are linked at a substitutable position with grouping B and substituted at another substitutable position with a radical D. Preferred heteroaromatic compounds are pyrrole, thiophene, imidazole, thiazole, oxazole, triazole, thiadiazole, indole, benzoxazole, benzothiazole, pyridine, and pyrimidine. In addition, the arylene or heteroarylene groups can be substituted with a methyl group or a halogen atom.

If a halogen atom is mentioned as a substituent in one of the radicals, a fluorine, chlorine, bromine or iodine atom is suitable for this purpose. Chlorine and fluorine are preferred.

For the purposes of the invention, the following compounds

09869000-062204

of general formula I are quite especially preferred:

1.  $7\alpha$ -(9-Chlorononyl)- $17\alpha$ -methyl-3-oxoandrost-4-en- $17\beta$ -yl-acetate
2.  $7\alpha$ -(9-Chlorononyl)- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one
3.  $17\beta$ -Hydroxy- $7\alpha$ -(9-iodononyl)- $17\alpha$ -methylandrost-4-en-3-one
4.  $17\beta$ -Hydroxy- $7\alpha$ -(9-hydroxynonyl)- $17\alpha$ -methylandrost-4-en-3-one
5.  $7\alpha$ -(10-Chlorodecyl)- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one
6.  $17\beta$ -Hydroxy- $7\alpha$ -(11-hydroxyundecyl)- $17\alpha$ -methylandrost-4-en-3-one
7.  $7\alpha$ -(11-Bromoundecyl)- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one
8.  $17\beta$ -Hydroxy- $17\alpha$ -methyl- $7\alpha$ -[7-(phenylsulfanyl)heptyl]-androst-4-en-3-one
9.  $17\beta$ -Hydroxy- $17\alpha$ -methyl- $7\alpha$ -[9-[(4,4,5,5,5-pentafluoropentyl)sulfanyl]nonyl]androst-4-en-3-one
10.  $17\beta$ -Hydroxy- $17\alpha$ -methyl- $7\alpha$ -[9-(phenylsulfanyl)nonyl]-androst-4-en-3-one
11.  $7\alpha$ -[9-[(5-Chloropentyl)sulfanyl]nonyl]- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one
12.  $17\beta$ -Hydroxy- $7\alpha$ -[9-[(5-hydroxypentyl)sulfanyl]nonyl]- $17\alpha$ -methylandrost-4-en-3-one
13.  $7\alpha$ -(9-Azidononyl)- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one

102290-00059860

14.  $7\alpha$ -[7-(Acetylsulfanyl)heptyl]- $17\beta$ -hydroxy- $17\alpha$ -methylandrost-4-en-3-one
15.  $17\beta$ -Hydroxy- $17\alpha$ -methyl- $7\alpha$ -[7-[(4,4,5,5,5-pentafluoropentyl)sulfanyl]heptyl]androst-4-en-3-one
16. N-[7-( $17\beta$ -Hydroxy- $17\alpha$ -methyl-3-oxoandrost-4-en- $7\alpha$ -yl)heptyl]pentanamide
17.  $17\beta$ -Hydroxy- $17\alpha$ -methyl-3-oxoandrost-4-en- $7\alpha$ -octane-nitrile
18. 5-[[7-( $17\beta$ -Hydroxy- $17\alpha$ -methyl-3-oxoandrost-4-en- $7\alpha$ -yl)heptyl]oxy]pentanenitrile
19.  $17\beta$ -Hydroxy- $17\alpha$ -methyl- $7\alpha$ -[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]androst-4-en-3-one
20. N-[9-( $17\beta$ -Hydroxy- $17\alpha$ -methyl-3-oxoandrost-4-en- $7\alpha$ -yl)nonyl]methanesulfonamide
21.  $7\alpha$ -(9-Chlorononyl)- $6\beta$ -hydroxy- $17\alpha$ -methyl-3-oxoandrost-4-en- $17\beta$ -yl-acetate

The production of the compounds according to the invention is carried out analogously to the synthesis methods that are described extensively in sterol and steroid literature. The following books form the basis for steroid synthesis: L. F. Fieser & M. Fieser: Steroids: Reinhold Publishing Corporation, NY 1959; Rood's Chemistry of Carbon Compounds (editor: S. Coffrey): Elsevier Publishing Company, 1971; and especially the "Dictionary of Steroids" (editors: R. A. Hill; D. N. Kirk; H. L. J. Makin and G. M. Murphy): Chapman & Hall. The latter contains a detailed reference list of the original publications up to 1990.

09869000-062201  
T02290-00069860

For the case of the production of compounds with a perfluoroalkyl radical in 17 $\alpha$ -position, the chain introduction in 7 $\alpha$ -position is carried out according to Sakurai (cf. K. Nickisch, H. Laurent, Tetrahedron Lett. 29, 1533-1536 (1988)) with subsequent introduction of a carbonyl protective group in 3-position and subsequent introduction of the perfluoroalkyl radical in 17 $\alpha$ -position according to the following diagram (cf. also Examples 1-43):

In the production of the compounds according to the invention, which have an alkyl or alkinyl group in 17 $\alpha$ -position, the chain introduction in 7 $\alpha$ -position can be carried out in a way that is known in the art with Grignard's reagent according to the subsequent diagram:

Additional derivatization of the alkylene iodide radical that is obtained in 7 $\alpha$ -position is done according to commonly used organic synthesis methods and can be performed analogously to these examples.

It has now been found that the compounds of general formula I according to the invention act as pure antiandrogens and thus completely block the androgen receptor activity. The compounds completely inhibit the androgen-stimulated growth of the human prostate carcinoma cell line LNCaP. The compounds according to the invention are thus suitable for long-term antiandrogen therapy for androgen-dependent diseases, such as, for example, carcinoma of the prostate, common acne, hirsutism, early puberty, sexual deviations, androgenic alopecia, non-malignant prostatic hyperplasia or seborrhea.

The subject of the invention is therefore also the use of the compounds of general formula I according to the invention and the compounds, mentioned as preferred, for long-term antiandrogen therapy for androgen-dependent diseases, especially carcinoma of the prostate.

The compounds according to the invention are administered as pharmaceutical compositions, which contain therapeutically effective amounts of one or more compounds of general formula I and optionally galenical adjuvants and/or vehicles, which allow oral or parenteral administration of the agent. The preparations are administered in doses of 1-2000 mg, preferably 5-1000 mg per administration. The subjects of the invention are therefore also

09369000-052201

pharmaceutical agents, which contain at least one testosterone derivative of general formula I.

The invention is to be explained in more detail in the embodiments below.

09869000-062201  
T02290-00069860

## Example 1

7 $\alpha$ -(8-Chlorooctyl)-17 $\beta$ -hydroxy-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-3-one1a) 3-Oxo-7 $\alpha$ -(prop-2-enyl)androst-4-en-17 $\beta$ -yl-acetate

38.6 ml of titanium tetrachloride is slowly added in drops to a solution of 23.11 g of 3-oxoandrosta-4,6-dien-17 $\beta$ -yl-acetate, whose production is described in Bowers et al., J. Amer. Chem. Soc. 81, 5991 (1959), in 1200 ml of dichloromethane at -78°C under nitrogen atmosphere. After ten minutes of stirring, 67 ml of trimethyl(prop-2-enyl)silane is added in drops at the same temperature. The reaction mixture is stirred for two hours at -78°C and carefully mixed with water at this temperature. The organic phase is washed in succession with water, saturated aqueous sodium bicarbonate solution and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. After column chromatography on silica gel with a mixture of hexane/ethyl acetate, 14.8 g of the title compound is obtained as a colorless foam.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  = 5.72 s (1H, H-4); 5.64 m (1H, allyl); 5.02 dbr (J = 10 Hz, 1H, allyl); 4.99 dbr (J = 17 Hz, 1H, allyl); 4.61 ddbr (J = 9 Hz + 8 Hz, 1H, H-17); 2.05 s (3H, acetate); 1.20 s (3H, H-19); 0.85 s (3H, H-18).

T02290-00069360

4.61 g of the compound that is produced under 1a) is dissolved in 50 ml of glacial acetic acid under nitrogen atmosphere and mixed with 1.04 ml of ethane-1,2-dithiol and with 1.18 g of 4-methylbenzenesulfonic acid monohydrate. The reaction mixture is stirred for four hours at room temperature, then poured onto 900 ml of 2 molar aqueous sodium hydroxide solution and extracted with dichloromethane. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 4.99 g of the title compound as a colorless foam.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ = 5.67 ddt (J = 17 Hz + 10 Hz + 7 Hz, 1H, allyl); 5.45 s (1H, H-4); 5.05 dbr (J = 17 Hz, 1H, allyl); 5.01 dbr (J = 10 Hz, 1H, allyl); 4.58 ddbr (J = 10 Hz + 8 Hz, 1H, H-17); 3.43-3.28 m (3H, dithiolane); 3.28-3.15 m (1H, dithiolane); 2.05 s (3H, acetate); 1.04 s (3H, H-19); 0.81 s (3H, H-18).

4.98 g of the compound that is described under 1b) is stirred with 1.69 g of potassium carbonate in 111 ml of methanol overnight at room temperature. The reaction mixture is largely concentrated by evaporation in a vacuum. The residue is taken up in water and extracted with ethyl acetate. The organic phase is

washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. 4.48 g of 1c) is obtained, which is used as crude product in the next step.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 5.67 ddt ( $J$  = 17 Hz + 10 Hz + 7 Hz, 1H, allyl); 5.44 s (1H, H-4); 5.03 dbr ( $J$  = 17 Hz, 1H, allyl); 5.01 dbr ( $J$  = 10 Hz, 1H, allyl); 3.64 m (1H, H-17); 3.45 - 3.29 m (3H, dithiolane); 3.29 - 3.15 m (1H, dithiolane); 1.05 s (3H, H-19); 0.77 s (3H, H-18).

1d) 3,3-[1,2-Ethanediylobis(thio)]-7 $\alpha$ -(prop-2-enyl)androst-4-en-17-one

4.47 g of the compound that is produced under 1c) is dissolved in 110 ml of toluene and refluxed with 5.11 ml of cyclohexanone and with 1.01 g of aluminum triisopropylate for five hours in a water separator. For working-up, it is diluted with ethyl acetate, filtered on Celite<sup>(R)</sup>, and re washed with ethyl acetate. The filtrate is concentrated by evaporation in a vacuum. Column chromatography of the residue on silica gel with a mixture of hexane/ethyl acetate yields 4.45 g of the title compound as a colorless foam.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 5.69 ddt ( $J$  = 17 Hz + 10 Hz + 7 Hz, 1H, allyl); 5.48 s (1H, H-4); 5.06 dbr ( $J$  = 17 Hz, 1H, allyl); 5.04 dbr ( $J$  = 10 Hz, 1H, allyl); 3.45-3.30 m (3H, dithiolane); 3.29-3.16 m (1H, dithiolane); 2.46 dd ( $J$  = 18 Hz + 9 Hz, 1H, H-16); 1.06 s (3H, H-19); 0.89 s (3H, H-18).

T02290: 00069860

1e) 3,3-[1,2-Ethanediyibis(thio)]-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)-7 $\alpha$ -(prop-2-enyl)androst-4-en-17 $\beta$ -ol

22 g of 1,1,1,2,2-pentafluoro-2-iodoethane is condensed in 100 ml of toluene at room temperature under nitrogen and mixed at -78°C with a solution of 4.44 g of the compound, produced under 1d), in 50 ml of toluene. After ten minutes, 51 ml of a 1.5 molar solution of methyllithium-lithium bromide complex in diethyl ether is slowly added in drops at the same temperature so that the internal temperature does not exceed -65°C. The reaction mixture is stirred in succession respectively for one hour at -78°C and at 0°C, then poured onto saturated aqueous ammonium chloride solution and extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. After column chromatography on silica gel with a mixture of hexane/ethyl acetate, 5.67 g of the title compound is obtained as a colorless foam.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  = 5.66 ddt (J = 17 Hz + 10 Hz + 7 Hz, 1H, allyl); 5.45 s (1H, H-4); 5.05 dbr (J = 17 Hz, 1H, allyl); 5.02 dbr (J = 10 Hz, 1H, allyl); 3.43-3.29 m (3H, dithiolane); 3.29-3.16 m (1H, dithiolane); 2.39 m (1H, H-12); 1.04 s (3H, H-19); 0.97 s (3H, H-18).

1f) 3,3-[1,2-Ethanediyibis(thio)]-7 $\alpha$ -(3-hydroxypropyl)-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-17 $\beta$ -ol

1.1 ml of a 10 molar solution of borane-dimethyl sulfide complex in tetrahydrofuran is added in drops to a solution of 5.65 g of the compound, produced under 1e), in 110 ml of tetrahydrofuran at 0°C under nitrogen atmosphere. After 90 minutes, 22 ml of 2 molar aqueous sodium hydroxide solution and 11 ml of 30% aqueous hydrogen peroxide solution are slowly added in drops at 0°C. The reaction mixture is stirred for one hour at 0°C, diluted with water and extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 2.34 g of the title compound as a colorless foam.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  = 5.48 s (1H, H-4); 3.64 m (2H, CH<sub>2</sub>OH); 3.43-3.28 m (3H, dithiolane); 3.28-3.16 m (1H, dithiolane); 2.39 m (1H, H-12); 1.04 s (3H, H-19); 0.96 s (3H, H-18).

1g) 3-[3,3-[1,2-Ethanediyibis(thio)]-17 $\beta$ -hydroxy-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-7 $\alpha$ -yl]propyl-(4-methylbenzenesulfonate)

2.3 g of the compound that is produced under 1f) is stirred with 3.26 g of 4-methylbenzenesulfonyl chloride and 6 ml of triethylazan in 85 ml of dichloromethane for four hours at room temperature under nitrogen atmosphere. The reaction mixture is poured into saturated aqueous sodium bicarbonate solution and

102230" 00069860

extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 1.8 g of the title compound as a colorless foam.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 7.81 d ( $J$  = 9 Hz, 2H, aryl); 7.37 d ( $J$  = 9 Hz, 2H, aryl); 5.40 s (1H, H-4); 4.06 m (2H,  $\text{CH}_2\text{OTs}$ ); 3.43-3.29 m (3H, dithiolane); 3.29-3.16 m (1H, dithiolane); 2.46 s (3H, tolyl); 2.36 m (1H, H-12); 1.02 s (3H, H-19); 0.94 s (3H, H-18).

1h) 3,3-[1,2-Ethanediyibis(thio)]-7 $\alpha$ -(3-iodopropyl)-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-17 $\beta$ -ol

1.75 g of the compound that is produced under 1g) is refluxed overnight with 490 mg of sodium iodide in 25 ml of acetone. The reaction mixture is filtered, and the filtrate is concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 1.36 g of the title compound as a colorless foam.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 5.48 s (1H, H-4); 3.44-3.29 m (3H, dithiolane); 3.29-3.15 m (1H, dithiolane); 3.18 t ( $J$  = 7 Hz, 2H,  $\text{CH}_2\text{I}$ ); 2.40 m (1H, H-12); 1.04 s (3H, H-19); 0.96 s (3H, H-18).

- 1i) 7 $\alpha$ -(8-Chlorooctyl)-3,3-[1,2-ethanediylbis(thio)]-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-17 $\beta$ -ol

A solution of the Grignard compound 5-chloropentylmagnesium bromide is produced from 214 mg of magnesium chips in 2.2 ml of tetrahydrofuran by adding in drops a solution of 1.16 ml of 1-bromo-5-chloropentane in 6.6 ml of tetrahydrofuran at an internal temperature below 35°C and with thirty more minutes of stirring. In another flask, a brown solution of dilithium tetrachlorocuprate is produced from 7.5 mg of lithium chloride and 11.8 mg of anhydrous copper(II) chloride in 0.88 ml of tetrahydrofuran by fifteen minutes of stirring at room temperature. 575 mg of the compound that is produced under 1h) and dissolved in 2 ml of tetrahydrofuran is added in drops to the above. At -10°C, the Grignard solution is added in drops to the steroid solution within one hour. During one more hour of stirring time, the reaction mixture reaches 0°C. It is then poured into saturated aqueous sodium bicarbonate solution and extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. After column chromatography on silica gel with a mixture of hexane/ethyl acetate, 342 mg of the title compound is obtained as a colorless oil.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  = 5.46 s (1H, H-4); 3.54 t (J = 7 Hz, 2H, CH<sub>2</sub>Cl); 3.43-3.29 m (3H, dithiolane); 3.29-3.14 m (1H, dithiolane); 2.39 m (1H, H-12); 1.05 s (3H, H-19); 0.97 s (3H, H-18).

1j) 7 $\alpha$ -(8-Chlorooctyl)-17 $\beta$ -hydroxy-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-3-one

330 mg of the compound that is produced under 1i) is dissolved in 16 ml of glacial acetic acid, mixed with 2.43 g of glyoxylic acid and stirred for 15 minutes at room temperature. Then, 2 ml of 4 molar aqueous hydrochloric acid is added. After one hour of stirring at room temperature, the reaction mixture is added in drops to 500 ml of 2 molar aqueous sodium hydroxide solution and extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 172 mg of the title compound as a colorless oil.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>):  $\delta$  = 5.73 s (1H, H-4); 3.54 t (J = 7 Hz, 2H, CH<sub>2</sub>Cl); 1.21 s (3H, H-19); 1.00 s (3H, H-18).

#### Example 2

17 $\beta$ -Hydroxy-7 $\alpha$ -(8-iodooctyl)-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-3-one

161 mg of the compound that is produced under 1j) is heated overnight to 80°C with 87 mg of sodium iodide in 3 ml of 2-butanone. The reaction mixture is diluted with water and extracted with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 5.72 s (1H, H-4); 3.19 t ( $J$  = 7 Hz, 2H,  $\text{CH}_2\text{I}$ ); 1.21 s (3H, H-19); 1.00 s (3H, H-18).

17 $\beta$ -Hydroxy-3-oxo-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)androst-4-en-  
7 $\alpha$ -nonane nitrile

$$^1\text{H-NMR (CDCl}_3\text{): } \delta = 5.72 \text{ s (1H, H-4); } 2.34 \text{ t (J = 7 Hz, 2H, CH}_2\text{CN); } 1.21 \text{ s (3H, H-19); } 1.00 \text{ s (3H, H-18).}$$

17 $\beta$ -Hydroxy-17 $\alpha$ -(1,1,2,2,2-pentafluoroethyl)-7 $\alpha$ -[8-(phenylsulfanyl)octyl]androst-4-en-3-one

80 mg of the compound that is produced under 2) is stirred with 22 mg of sodium phenyl thiolate in 1.5 ml of ethanol for 16 hours at 60°C. The reaction mixture is concentrated by evaporation in a vacuum and taken up in ethyl acetate. The

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ = 7.36-7.24 m (4H, aryl); 7.17 ddb (J = 8 Hz + 8 Hz, 1H, aryl); 5.73 s (1H, H-4); 2.92 t (J = 7 Hz, 2H, CH<sub>2</sub>S); 1.21 s (3H, H-19); 1.00 s (3H, H-18).

17β-Hydroxy-17α-(1,1,2,2,2-pentafluoroethyl)-7α-[8-(phenylsulfinyl)octyl]androst-4-en-3-one

<sup>1</sup>H-NMR (CDCl<sub>3</sub>): δ = 7.61 dbr (J = 8 Hz, 2H, aryl); 7.57-7.45 m (3H, aryl); 5.72 s (1H, H-4); 2.79 t (J = 7 Hz, 2H, CH<sub>2</sub>SO); 1.21 s (3H, H-19); 1.00 s (3H, H-18).

## Example 6

7 $\alpha$ -[8-[(2-Chlorophenyl)sulfanyl]octyl]-17 $\beta$ -hydroxy-17 $\alpha$ -  
(1,1,2,2,2-pentafluoroethyl)androst-4-en-3-one

5.9  $\mu$ l of 2-chlorobenzenethiol is added to a suspension of 2.1 mg of 60% sodium hydride as a dispersion in mineral oil in 1 ml of N,N-dimethylformamide. After one hour at room temperature, 30 mg of the compound that is produced under 2) and dissolved in 1 ml of N,N-dimethylformamide is added. The reaction mixture is stirred for 14 hours at room temperature, diluted with water and extracted with ethyl acetate. The organic phase is washed with saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. Column chromatography on silica gel with a mixture of hexane/ethyl acetate yields 17 mg of the title compound as a colorless oil.

$^1\text{H-NMR}$  ( $\text{CDCl}_3$ ):  $\delta$  = 7.36 dbr ( $J$  = 8 Hz, 1H, aryl); 7.26 dbr ( $J$  = 8 Hz, 1H, aryl); 7.22 ddbr ( $J$  = 8 Hz + 8 Hz, 1H, aryl); 7.09 ddbr ( $J$  = 8 Hz + 8 Hz, 1H, aryl); 5.73 s (1H, H-4); 2.93 t ( $J$  = 7 Hz, 2H,  $\text{CH}_2\text{S}$ ); 1.21 s (3H, H-19); 1.00 s (3H, H-18).

## Example 44

7 $\alpha$ -[9-[[[(1,1-Dimethylethyl)dimethylsilyl]oxy]nonyl]-17 $\alpha$ -methyl-3-oxoandrost-4-en-17 $\beta$ -yl-acetate

2.82 g of magnesium chips (116 mmol) is suspended in 56 ml of dry tetrahydrofuran, and the formation of the Grignard compound is begun with a little [(9-bromononyl)oxy] (1,1-dimethylethyl)dimethylsilane, some dibromomethane and some granules of iodine. After the start-up, the solution of a total of 39.0 g of [(9-bromononyl)oxy] (1,1-dimethylethyl)dimethylsilane (116 mmol) in 36 ml of dry tetrahydrofuran is added drop by drop so that the internal temperature does not exceed 35°C. Then, the solution is heated for 15 minutes to 80°C and then mixed at -60°C with a solution that was prepared from 11.0 g of copper(I) iodide (58 mmol) in 54 ml of dry tetrahydrofuran by adding 20.1 g of lithium bromide (132 mmol) while being cooled with ice and diluted with 21 ml of 1,3-dimethyl-3,4,5,6-tetrahydro-2(1H)-pyrimidinone. With the addition, the internal temperature is not to exceed -50°C. After 15 minutes of stirring at -20°C, it is cooled to -70°C, and the solution of 17 $\alpha$ -methyl-3-oxoandrost-4,6-dien-17 $\beta$ -yl acetate (40 mmol), whose production is described in V. Schwarz, Collect. Czech. Chem. Commun. 26, 1958-1966 (1961), and 13 ml of chlorotrimethylsilane in 60 ml of dry tetrahydrofuran and 16 ml of 1,3-dimethyl-3,4,5,6-tetrahydro-2(1H)-pyrimidinone are quickly added so that the internal temperature does not exceed -65°C. The mixture is stirred for one hour, whereby the temperature reaches -50°C, and finally it is mixed with 16 ml of glacial acetic acid and left for another

**Example 49****7 $\alpha$ -(9-Hydroxynonyl)-17 $\alpha$ -methyl-3-oxoandrost-4-en-17 $\beta$ -yl-acetate**

13.9 g of the compound (23 mmol) that is produced under 44) is dissolved in 150 ml of methanol/tetrahydrofuran (2:1), 25 ml of 8% aqueous sulfuric acid is added, and it is stirred for 2 hours at room temperature. Then, it is diluted with ethyl acetate, washed out with saturated aqueous common salt solution, and the organic phase is concentrated by evaporation with sodium sulfate after drying. The residue is chromatographed on silica gel with dichloromethane/hexane, and the yield is 10.8 g (96% of theory) of the title compound.

**Example 50****7 $\alpha$ -(9-Chlorononyl)-17 $\alpha$ -methyl-3-oxoandrost-4-en-17 $\beta$ -yl-acetate**

10.8 g of the compound that is produced under 49) is dissolved in 100 ml of tetrachloromethane and 35 ml of acetonitrile and reacted with 10.5 g of triphenylphosphine (40 mmol) at room temperature for 1 hour. Then, it is diluted with dichloromethane, shaken out with saturated aqueous sodium

T02290-00069860

bicarbonate and common salt solution, and the organic phase is dried with sodium sulfate and concentrated by evaporation. The oily residue is chromatographed on silica gel with hexane/<sup>t</sup>butyl methyl ether, yield 10.2 g (91% of theory) of the title compound.

**Example 69****17 $\beta$ -Hydroxy-17 $\alpha$ -methyl-7 $\alpha$ -[9-[(4,4,5,5,5-pentafluoropentyl)sulfanyl]nonyl]androst-4-en-3-one**

0.07 ml of a 30% solution of sodium methanolate in methanol (0.33 mmol) is added to a solution of 69 mg of thioacetic acid-S-(4,4,5,5,5-pentafluoropentyl)ester (0.3 mmol), whose production is described in Li et al., *Tetrahedron Lett.* 35, 9141-9144 (1994), in 0.7 ml of methanol, and it is stirred for 30 minutes at room temperature. Then, a solution of 128 mg of the compound (0.23 mmol), produced under 52), in 2.3 ml of N,N-dimethylformamide is added. The reaction mixture is stirred overnight at room temperature, mixed with water and extracted three times with ethyl acetate. The organic phase is washed in succession with water and saturated aqueous sodium chloride solution, dried on sodium sulfate, filtered and concentrated by evaporation in a vacuum. The residue is chromatographed on silica gel with ethyl acetate/hexane, and the yield is 95 mg (66% of theory) of the title compound. MS: Cld. 620, Fnd. 620.

17 $\beta$ -Hydroxy-17 $\alpha$ -methyl-7 $\alpha$ -[9-[(4,4,5,5,5-pentafluoropentyl)sulfinyl]nonyl]androst-4-en-3-one

83 mg of the compound that is produced under 69) is dissolved in 5 ml of dichloromethane, cooled in an ice bath, and 32 mg of 70% 3-chloroperbenzoic acid is added. After 15 minutes of stirring, it is mixed with saturated aqueous sodium thiosulfate solution, stirred for another 15 minutes and then diluted with dichloromethane. The organic phase is washed with saturated aqueous sodium bicarbonate solution and common salt solution, dried with sodium sulfate and concentrated by evaporation. The residue is chromatographed on silica gel on a thin-layer plate with acetone/hexane, and the yield is 52 mg (62% of theory) of the title compound. MS: Cld. 636, Fnd. 636.

**Example 101****17 $\beta$ -Hydroxy-17 $\alpha$ -methyl-3-oxoandrost-4-ene-7 $\alpha$ -heptanoic acid**

416 mg of the compound (1 mmol) that is produced under 55) is dissolved in 10 ml of anhydrous acetone and mixed with 5 ml of a 1 molar solution of Jones reagent (chromate solution) while being cooled with ice. After 15 minutes, it is mixed with saturated aqueous sodium sulfite solution, the acid solution is shaken out with ethyl acetate, the organic phase is extracted with saturated aqueous common salt solution, dried with sodium sulfate and concentrated by evaporation. The residue is chromatographed on silica gel with acetone/hexane, and the yield

09869000-06201

is 78 mg (18% of theory) of the title compound. MS: Cld. 430, Fnd. 430.

**Example 102**

**N-Butyl-17 $\beta$ -hydroxy-N,17 $\alpha$ -dimethyl-3-oxoandrost-4-ene-7 $\alpha$ -heptanamide**

78 mg of the compound that is produced under 101) is dissolved in 6 ml of dichloromethane, cooled to -10°C and mixed in succession with 30  $\mu$ l of 4-methylmorpholine, 30  $\mu$ l of chloroformic acid-(2-methylpropyl)ester and after 10 minutes with 40  $\mu$ l of butylmethylazan. After 1 hour of stirring at room temperature, it is diluted with dichloromethane, extracted in succession with 1 molar aqueous sulfuric acid, saturated aqueous sodium bicarbonate solution and saturated common salt solution, the organic phase is dried with sodium sulfate and concentrated by evaporation. The residue is chromatographed on silica gel with acetone/hexane, and the yield is 40 mg (45% of theory) of the title compound. MS: Cld. 499, Fnd. 499.

**Example 109****2-[9-(17 $\beta$ -Hydroxy-17 $\alpha$ -methyl-3-oxoandrost-4-en-7 $\alpha$ -yl)nonyl]propanedioic acid-diethyl ester**

109a) 7 $\alpha$ -(9-Chlorononyl)-3,3-[1,2-ethanediylbis(oxy)]-17 $\alpha$ -methylandrost-4-en-17 $\beta$ -ol

1.48 g of the compound that is produced under 51) is dissolved in 20 ml of dichloromethane, and 20 ml of 1,2-ethanediol, 12 ml of trimethoxymethane and 0.6 g of pyridinium-p-toluenesulfonate are added. The mixture is stirred overnight at room temperature, then mixed with triethylazan, diluted with dichloromethane and shaken out with water and saturated aqueous common salt solution. The organic phase is dried with sodium sulfate, concentrated by evaporation and chromatographed on silica gel with hexane/butyl methyl ether. The yield is 1.12 g

09869000-062301

(69% of theory) of the title compound. MS: Cld. 506/508; Fnd. 506/508.

109b) 3,3-[1,2-Ethanediylobis(oxy)]-7 $\alpha$ -(9-iodononyl)-17 $\alpha$ -methylandro-4-en-17 $\beta$ -ol

1.09 g of the compound that is produced under 109a) is reacted analogously to the process that is described in Example 2) with 1.5 g of sodium iodide to form 1.37 g of the title compound as a colorless oil. MS: Cld. 598, Fnd. 598

109c) 2-[9-(17 $\beta$ -Hydroxy-17 $\alpha$ -methyl-3-oxoandro-4-en-7 $\alpha$ -yl)nonyl]propanedioic acid-diethyl ester

80 mg of propanedioic acid-diethyl ester in 0.5 ml of anhydrous tetrahydrofuran is deprotonated with 12 mg of 80% sodium hydride, 60 mg of the compound (0.1 mmol), produced under 109b), in 1 ml of anhydrous N,N-dimethylformamide is added, and it is heated for 5 hours to 80°C. After cooling, it is worked up as usual with ethyl acetate. The residue is dissolved in 0.5 ml of acetone and stirred with 0.1 ml of 4 molar aqueous hydrochloric acid for 15 minutes at room temperature. Then, it is worked up with ethyl acetate again and chromatographed. The yield is 29 mg (49% of theory) of the title compound. MS: Cld. 586, Fnd. 586.

## Example 114

7 $\alpha$ -(9-Chlorononyl)-6 $\beta$ -hydroxy-17 $\alpha$ -methyl-3-oxoandrost-4-en-17 $\beta$ -yl-acetate

3.3 g of the compound that is produced under 50) is dissolved in 22 ml of 2,2-dimethoxypropane, 0.4 g of pyridinium-p-toluenesulfonate is added, and it is refluxed for 22 hours. After the cooling, it is mixed with triethylazan and evaporated to the dry state. The residue is chromatographed on silica gel with hexane/butyl methyl ether. 2.91 g of 7 $\alpha$ -(9-chlorononyl)-3-methoxy-17 $\alpha$ -methylandrosta-3,5-dien-17 $\beta$ -yl-acetate-(84% of theory) is obtained and is immediately further reacted.

This substance is suspended in 60 ml of a mixture of ethanol/water 95:5, mixed with 1.7 g of 3-chloroperbenzoic acid (6.8 mmol) and stirred for 45 minutes at room temperature. Then, 5 ml of 2 molar aqueous sulfuric acid is added, stirred for 15 minutes at room temperature and diluted with ethyl acetate. The organic phase is shaken out with water and saturated aqueous solutions of sodium dithionate, sodium bicarbonate and common salt, dried with sodium sulfate and concentrated by evaporation. After chromatography on silica gel with hexane/ethyl acetate, 1.0 g (30% of theory) of the title compound is obtained. MS: Cld. 520/522, Fnd. 520/522.

096000-06201

**000000000000000000000000**

Execution:

Day 1: Sowing of the cells in a density of 5,000-6,000/100  $\mu$ l/hole in 96-hole plates. Adding test compound (100  $\mu$ l/hole doubly concentrated) to the culture medium with 0.2 nM of R1881 (yields 0.1 nM final concentration). Incubation of the cells for 72 or 96 hours at 37°C, 5% CO<sub>2</sub>, 90% relative atmospheric humidity. In the culture medium, the fetal calf serum is replaced by 5% activated carbon-treated (steroid-free) serum.

Day 3 or 4: Medium change: In each case in 50% of the medium, inclusive test compounds are replaced by fresh medium. Incubation of the cells for 96 or 72 hours at 37°C, 5% CO<sub>2</sub>, 90% relative atmospheric humidity.

Day 7: Adding 25 µl of MTT solution per hole {MTT = (3[4,5-dimethylthiazol-2-yl]-2,5-diphenaltetrazolium bromide (thiazolyl blue)}. Incubation is for 3 hours at 37°C, 5% CO<sub>2</sub>, 90% relative atmospheric humidity. After the removal of the supernatant, addition of 100 µl of DMSO per hole. Measurement of the optical density at 570 nm.

The antiandrogens OH-flutamide and casodex that are found in clinical practice were tested, as well as the compound EM-101 (N-butyl, N-methyl-11-(17'β-hydroxy-4'-androsten-3'-on-7'α-yl)undecanamide of WO 91/00732.

09659000-062201  
T02250-00069860

	Antiandrogeneity	Androgeneity
	IC50 in the presence of 0.1 nM of R1881	at 1 $\mu$ M*
OH-flutamide	> 10,000 nM	144%
Casodex	440 nM	7%
EM-101	4440 nM	0%
Example 53	40 nM	0%
Example 80	200 nM	0%
Example 87	82 nM	0%

The results show that the compounds according to the invention exert no androgenic action in the case of an improved antiandrogenic action (lower  $IC_{50}$  values).
